LAST LIGHT ACADEMY · CREW NOTES

Seven Shifts, the night plan · Class mode · one card per role · private until you choose to share

1. Deal one card per role. With 2 or 3 players, use the seat plan below.
2. Read your card privately. Tell the crew what matters in your own words.
3. Discuss. Then each role signs the team plan on screen before the operator locks it in.
4. Cards arrive at different shifts: keep later cards face down until the screen says they have arrived.

SEAT PLANS

2 players · Player 1: Kai and Mei · Player 2: Amara and Rafi

3 players · Player 1: Kai and Amara · Player 2: Mei · Player 3: Rafi

4 players · Player 1: Kai · Player 2: Amara · Player 3: Mei · Player 4: Rafi

Mei and Rafi never share a seat: the shift 3-4 decision (when to fill the wall and when to return the water) only becomes clear when their two notes meet in discussion (10_GAMEPLAY_SYSTEMS.md, combined-evidence decision).

ARRIVAL

Kai: shift 1 · Amara: shift 1 · Mei: shift 3 · Rafi: shift 2

Training units, not real measurements. Aurora Station, the cadets and the 2046 dates are fictional. Independent team project · not NASA-endorsed.

KAI Power and heat

Arrives at shift 1 · 4 players: Player 1 · 3 players: Player 1 · 2 players: Player 1

"Same full jar. Better destination." — Kai

- The battery holds 20. Daylight adds 8 in shifts 1 and 2 only; anything above 20 is lost.
- Shifts 3 to 7 are dark: five shifts, 36 hours, running only on what is stored.
- Every shift costs 1 for basics, plus heat (night only), the air maker and the garden light.
- A demand below zero is a blackout: the battery resets to 0 and air, Alo and the crop each lose 2. Ending a shift at exactly 0 is an empty-battery warning, not a blackout.

Training units, not real measurements. Aurora Station, the cadets and the 2046 dates are fictional. Independent team project · not NASA-endorsed.

AMARA Atmosphere

Arrives at shift 1 · 4 players: Player 2 · 3 players: Player 1 · 2 players: Player 2

"We can keep air we make now. We cannot keep overflow." — Amara

- The air tank holds 10. The crew of four breathes 1 per shift.
- The air maker turns 1 energy into 1 air, up to 2 per shift, before breathing.
- Make air while sunlight would overflow the battery.
- If air reaches 0, the flight rules stop the mission.

Training units, not real measurements. Aurora Station, the cadets and the 2046 dates are fictional. Independent team project · not NASA-endorsed.

MEI Horticulture

Arrives at shift 3 · 4 players: Player 3 · 3 players: Player 2 · 2 players: Player 1

"Read my cold-and-thirst card with Rafi's warning." — Mei

- Garden light changes Alo and the crop each shift: OFF −1, DIM 0, FULL +1.
- At night COOL costs Alo 1. COLD costs Alo 2 and the crop 1. COZY costs neither.
- The water wall borrows garden water. At 4 or more after the transfer, Alo and the crop are thirsty: −1 each.
- Alo at 0 cannot recover in this attempt.

Training units, not real measurements. Aurora Station, the cadets and the 2046 dates are fictional. Independent team project · not NASA-endorsed.

PRIVATE · keep it face down until you share

RAFI Safety

Arrives at shift 2 · 4 players: Player 4 · 3 players: Player 3 · 2 players: Player 2

"First rule: the crew goes inside." — Rafi

- A large solar flare was observed. In this training scenario a particle event may follow during shifts 5 and 6.
- Shelter S = water wall + supply crates, at most 6. Dose per storm shift: S 0–1 gives 3, 2–3 gives 2, 4–5 gives 1, 6 gives 0.
- The crew exposure limit is 3 game units for the night. These are training units, not sieverts.
- One water transfer per shift: FILL +2, DRAIN −2 or HOLD. At shift 5 the alarm response replaces it. Crates come down before shift 7.

Training units, not real measurements. Aurora Station, the cadets and the 2046 dates are fictional. Independent team project · not NASA-endorsed.
